## 1.0 INTRODUCTION

This Revised Limited Phase II Environmental Site Assessment Report (Report) has been prepared by RETTEW Associates, Inc. on behalf of the Borough of Columbia (the Borough), to document environmental assessment activities conducted at the McGinness Properties (the Site), located at 1020 Manor Street in the Borough of Columbia and West Hempfield Township, Lancaster County, Pennsylvania. The Site is known as the "McGinness Airport" and is currently owned by the George McGinness Revocable Trust of 2007 and the Dorothy McGinness Revocable Trust of 2007. The Site is currently used for crop production, an unoccupied dwelling and garage, and as vacant land. A Site Location Map is included as **Figure 1**.

A Phase I Environmental Site Assessment (ESA) conducted at the Site by RETTEW in June 2017 identified several recognized environmental conditions (RECs) associated with both past and current land uses. Based on the findings of the Phase I ESA, RETTEW recommended a limited investigation of soil quality in the vicinity of each REC to confirm the presence or absence of environmental impacts.

A Limited Phase II ESA was delivered to the Borough on June 30, 2017. A subsequent Site visit was performed that revealed two additional RECs. The purpose of this Revised Limited Phase II ESA was to provide updated investigative findings of current environmental quality at each REC and compare results to applicable Pennsylvania Department of Environmental Protection (PADEP) remediation standards. The findings were used to develop recommendations for remedial action in accordance with Pennsylvania's Land Recycling and Remediation Standards Act (Act 2) standards, and PA Code, Title 25, Chapter 250 titled *Administration of the Land Recycling Program*. The Limited Phase II ESA investigative methods, findings and recommendations are presented in the following sections of this report.

## 2.0 SITE DESCRIPTION AND BACKGROUND

The Site is approximately 58 acres and consists of eight tax parcels located within the Borough of Columbia, with the southern portion of one parcel (950 S. 13<sup>th</sup> Street) extending into West Hempfield Township. The former airport runway areas are now cultivated. Improvements at the Site include a 2 ½-story residential structure, a one-story masonry garage, and a 10'x12' frame shed. Three underground storage tanks (USTs) are present at the Site, as well as gravel access roads, overhead electric utilities, sanitary sewer and public water utilities. An Aerial Basemap is included as **Figure 2** showing improvements and other items of interest at the Site.

The Site is served by sanitary sewer and a public water supply. There are reportedly no water supply wells or septic systems on the Site. A former retirement home (Wilmac) and former dwelling were located on the 1015 Plane Street parcel. The Site was actively used as an airfield from 1945 to 2014 for small aircraft. The Site structures are currently unoccupied, and the open areas of the Site are cultivated with wheat crops. Residential, agricultural, commercial, and industrial properties surround the Site, which is also bordered by an active Norfolk Southern Railway corridor to the south.

Land use at the Site has historically been agricultural, with a quarry operation in the southern portion of the Site. The quarry was in operation prior to 1940, and the remainder of the site was developed by George McGinness thereafter. The airfield was constructed around 1945, and the residential structure at the Site was constructed around 1960. The former hangar buildings were built sometime after 1945, and were reportedly destroyed by fire and an ice storm approximately 15-20 years ago. The northernmost hangar was also used as a roller skating rink.

The Borough intends to purchase the Site for redevelopment. Although a redevelopment plan is not available as of the date of this report, the intended future use of the property will be for commercial and industrial (i.e., nonresidential) purposes according to the Borough. The Site property boundary survey

completed during June 2017 includes two conservation easements that would further restrict land use. It is not known which land use right(s) the Borough will retain within the conservation easements. It is assumed that the conservation easements will be open to public access for recreational use until otherwise specified. The PADEP typically applies the more stringent residential remediation standards for recreational land use. For the purpose of this report, it is assumed that residential remediation standards will apply within the conservation easements.

## 2.1 PHASE I ESA SUMMARY

A Phase I ESA was conducted at the Site by RETTEW in June 2017 to satisfy environmental due diligence as part of potential sale of the property. The Phase I ESA identified several RECs associated with both past and current land uses that warranted further evaluation. These RECs are shown on **Figure 2** and were identified as follows.

### Underground Storage Tanks

Fill and vent pipes associated with two approximately 2,000-gallon aviation gasoline USTs and one approximately 3,000-gallon #2 fuel oil UST are located on the west and south sides of the existing one-story masonry garage. A pump dispenser mount was also noted adjacent to the aviation gasoline USTs. The aviation gasoline USTs were used to fuel aircraft at the Site. The fuel oil UST stored fuel for an oil-burning furnace used to heat the hangar buildings. The USTs have been out of service since the 1970s, although the fuel oil UST is known to contain a significant amount of fuel. The aviation gasoline USTs were reportedly “inspected” in 2014, and were found to be liquid empty and contain only a minor amount of condensation.

### Western Fill Areas (S. 9<sup>th</sup> Street)

Fill areas are located on the western portion of the Site east of S. 9<sup>th</sup> Street. Access to the fill areas is provided via a locking gate at S. 9<sup>th</sup> Street and existing gravel road. The fill materials were reportedly transported to the Site by Miller Pipeline Company (a contractor for UGI) and were historically utilized to extend the end of the airfield south of S. 9<sup>th</sup> Street. Fill material was also placed in an adjacent wooded area. Miller Pipeline Company and Pennsy Supply had utilized the Site for the disposal of fill materials from local natural gas pipeline upgrade projects over the past 14 years. The fill materials reportedly consist of blacktop, aggregate, road base materials and concrete.

### Eastern Fill Area (S. 13<sup>th</sup> Street)

A fill area is located on the eastern portion of the Site west of S. 13<sup>th</sup> Street on the 1020 Manor Street and 830 S. 13<sup>th</sup> Street parcels. According to interviews conducted during the Phase I ESA, foundry sand and “cores” from the former Grinnell foundry in Columbia (now Anvil International) were used as fill to extend the eastern end of the runway. Access to the fill area is provided via S. 12<sup>th</sup> Street and traversing the cultivated field.

### Northern Fill Area (1020 Manor Street)

Although not specifically discussed in the Phase I ESA report, a northern fill area was identified in conjunction with the Phase II ESA. This area was formerly a depression which was backfilled with foundry sand in the 1950s and 1960s.

### Former Quarry

The former quarry has been inactive since at least 1940. The area is overgrown with dense vegetation and underbrush. Portions of the quarry area are filled with water. No surficial debris or evidence of waste disposal was observed in the quarry area; however, according to interviews conducted during the Phase I ESA, machine oil from local machine shops had previously been “dumped” in the quarry to deter locals

from swimming in the quarry. One individual interviewed recalled seeing an "oil slick" in the quarry on several occasions.

### 3.0 GEOLOGIC AND HYDROGEOLOGIC SETTING

According to publications of the Pennsylvania Bureau of Topographic and Geologic Survey<sup>1</sup>, the Site is located in the Piedmont Lowland Section of the Piedmont Physiographic Province of Pennsylvania, and is underlain by complexly folded and faulted limestone and dolomite. Local topography is characterized by broad, moderately dissected karst valleys separated by broad, low hills. According to the USGS 7.5-minute Columbia East Quadrangle (**Figure 1**), the Site is situated at an approximate elevation of 320 feet. Surface topography slopes toward the south and southwest. Strickler Run flows across the southeastern corner of the Site and discharges to the Susquehanna River, located approximately 700 feet southwest of the southern Site boundary.

According to the Pennsylvania Bureau of Topographic and Geologic Survey, most of the Site is underlain by the Conestoga Formation, with the southern property boundary underlain by the Vintage Formation<sup>2</sup>. A Geology Map is included as **Figure 3**. The Conestoga Formation is described as a medium-gray, impure limestone having black, graphitic shale partings. It is conglomeratic at its base. This formation is crudely to poorly bedded, thin, and highly crumpled. Joints in this formation have an irregular pattern, are poorly formed, moderately abundant, widely spaced, and they have uneven regularity. Many joints are open but some are filled with quartz and calcite. This formation is moderately resistant to weathering. It is slightly weathered to a shallow depth. The resulting mantle thickness is highly variable and may be extremely thick. The interface between bedrock and mantle is pinnacled in most places<sup>3</sup>.

The Vintage Formation is described as dark gray, knotty, argillaceous dolomite having impure, light gray marble at the base. This formation is moderately well bedded and massive. Joints have a blocky pattern, are moderately to well developed, are moderately abundant, are irregularly spaced having a wide distance between fractures, and are open and steeply dipping. This formation is moderately resistant to weathering and is slightly to moderately weathered to a shallow depth. The overlying soil mantle is thin and pinnacles characterize the interface between mantle and bedrock<sup>3</sup>.

In the carbonate rocks that underlie the Site, groundwater occurs in fractures and voids of secondary porosity resulting from solution of the rock<sup>4</sup>. Groundwater moves through the network of interconnected secondary fractures and joints in the bedrock aquifer. When these water-bearing fractures and voids are penetrated by a well, the water level in the well will rise to the level within the aquifer. Because there are no sharply defined confining units in the carbonate rocks, the aquifer is characterized as one interconnected water-table aquifer. Groundwater typically flows from areas of higher elevation and discharges to perennial streams in lower topographic settings.

## 4.0 SITE ASSESSMENT METHODS

### 4.1 SUBSURFACE UTILITY SURVEY

On May 10, 2017, a RETTEW geophysicist performed a subsurface utility survey near the USTs and garage areas. The survey was completed utilizing an M-Scope, electromagnetic (EM) and ground penetrating radar (GPR) equipment. The purpose of the survey was to identify the UST locations, trace subsurface anomalies, and resolve potential utility conflicts near proposed soil borings. The footprint of the USTs, as well as other anomalies and potential drilling conflicts, were marked on the ground with paint prior to staking soil boring locations in the field.

### 4.2 SOIL BORING INSTALLATION AND SOIL SAMPLE ANALYSIS

On June 1, 2017, 11 soil borings (identified as SB-1 through SB-11) were advanced at the Site to investigate soil quality surrounding the USTs using track-mounted, direct-push Geoprobe® tooling provided by VonNeida Environmental LLC, of Ephrata, Pennsylvania. Soil boring locations were placed around the perimeter of the USTs at a distance of approximately seven feet. Soil borings SB-1 through SB-6 were located around the perimeter of the two aviation gasoline USTs, and soil borings SB-7 through SB-11 were located around the perimeter of the fuel oil UST as shown on **Figure 4**.

Soil samples were collected continuously over the entire boring interval using the Geoprobe. RETTEW personnel documented the lithology encountered in each soil boring and field-screened the soil using a photoionization detector (PID) to detect the presence of volatile organic compounds (VOCs) and petroleum compounds. The soil borings were advanced to depths ranging from 12 to 14 feet below ground surface (bgs). Equipment refusal (i.e., the limestone bedrock surface) was encountered in each boring and drilling was terminated. Lithology was generally classified by RETTEW as lean silty clay and silt overlying gray sandy weathered limestone and competent limestone bedrock. Groundwater was encountered in four of the borings (SB-1, SB-3, SB-4 and SB-11) at depths ranging from nine to 11 feet bgs. Soil boring logs documenting field observations are provided in **Appendix A**.

During soil sampling at SB-1 through SB-6, PID field screening revealed the presence of VOCs in each boring, with maximum PID readings ranging from 92 parts per million (ppm) at SB-2 to 1,200 ppm at SB-3. Maximum PID readings generally occurred at the depth where groundwater was encountered in SB-1, SB-3 and SB-4. One soil sample was collected for laboratory analysis at the depth interval of the maximum PID reading. Due to the lack of detectable VOCs during field screening at SB-7 through SB-11, one soil sample was collected from each soil boring near the terminal depth above the bedrock surface. Each soil sample was preserved in the field using laboratory bottleware, placed in a cooler with ice, and delivered to Lancaster Laboratories Environmental (LLE) following standard chain-of-custody procedures for analysis of the PA DEP Short List of Petroleum Products for aviation gasoline and #2 fuel oil. Soil sample laboratory analytical reports are included as **Appendix B**. A soil sample analytical data summary for the USTs is included as **Table 1**.

### 4.3 WESTERN FILL AREAS TEST PIT EXCAVATION, SAMPLING AND ANALYSIS

On June 2 2017, six test pits (identified as TP-1 through TP-6) were excavated throughout the Western Fill Areas (see **Figure 2**). Sample locations were selected based on the Phase I ESA findings and a review of historical aerial photos, which show that most of the fill material was placed on the Site after 1990.

Test pit excavation was performed by Richard T. Wimer (RTW) of Quarryville, Pennsylvania, using a backhoe. Test pits were excavated to reach native soil, or to a depth of 14 feet bgs, the maximum reach of the backhoe. During the excavation of each test pit, fill materials were observed over the entire depth penetrated and consisted primarily of asphalt, concrete, brick, crushed stone, road millings and loose soil.

Test pits TP-1, TP-2 and TP-3 were excavated to 14 feet bgs and did not reach native soil. During the excavation of TP-1, TP-2 and TP-3, minor amounts of other fill materials (metal pipe, glass, ash, stone, etc.) were encountered. Test pits TP-4, TP-5 and TP-6 were excavated to nine, 10 and 10 feet bgs, respectively, where brown clayey silt native soil was encountered. The fill materials encountered in these test pits were predominantly asphalt, road millings and crushed stone. Based on the type of fill observed and the approximate time of placement (since 1990), the fill is characterized as construction and demolition waste that was used to bring areas of the Site up to present grade.

Samples of the fill material were collected from each of the test pit depths for laboratory analysis. All fill samples were collected with a hand trowel, which was decontaminated with an Alconox wash and fresh water rinse between sampling locations. Each fill sample was preserved in the field using laboratory bottleware, placed in a cooler with ice, and delivered to LLE following standard chain-of-custody procedures for analyses Priority Pollutant List (PPL) VOCs, PPL semi-volatile organic compounds (SVOCs), pesticides and herbicides, and PPL metals. Each sample of fill material was also analyzed using the Synthetic Precipitation Leaching Procedure (SPLP) to characterize the potential for regulated substances to leach from the fill and impact groundwater.

In addition to the fill samples, samples of the native soil were collected at TP-4, TP-5 and TP-6. The soil samples were preserved in the field using laboratory bottleware, placed in a cooler with ice, and delivered to LLE following standard chain-of-custody procedures for analyses PPL VOCs, PPL SVOCs, pesticides and herbicides, and PPL metals. Sample analytical results are summarized on **Table 2**. SPLP analytical results are summarized on **Table 3**. Laboratory analytical data reports are attached in **Appendix B**.

#### **4.4 EASTERN FILL AREA TEST PIT EXCAVATION, SAMPLING AND ANALYSIS**

On July 5, 2017, five test pits (identified as TP-1 through TP-5) were excavated throughout the Eastern Fill Area (see **Figure 2**). Sample locations were selected based on the Phase I ESA interview information. Historical aerial photos do not show evidence of fill placement on the eastern portion of the Site.

Test pit excavation was performed by RTW using a backhoe. Test pits were excavated to reach native soil, or to a depth of 15 feet bgs, the maximum reach of the backhoe. During the excavation of each test pit, fill materials were observed, which consisted primarily of a black granular matrix with minor amounts of other fill materials such as slag, metal fragments, brick, stone and rock. Test pit TP-1 was excavated to 15 feet bgs and did not reach native soil. The remaining test pits were excavated to depths ranging from four to eight feet bgs. Native soil was observed in test pits TP-2 and TP-4 at depths of 4.5 and eight feet bgs, respectively. Based on the type of fill observed and the approximate time of placement (prior to 1980), the fill is characterized as residual industrial process waste that was used to bring areas of the Site up to present grade.

Samples of the fill material were collected from each of the test pit depths for laboratory analysis. All fill samples were collected with a hand trowel, which was decontaminated with an Alconox wash and fresh water rinse between sampling locations. Each fill sample was preserved in the field using laboratory bottleware, placed in a cooler with ice, and delivered to LLE following standard chain-of-custody procedures for analyses Priority Pollutant List (PPL) VOCs, PPL semi-volatile organic compounds (SVOCs), pesticides and herbicides, and PPL metals. Each sample of fill material was also analyzed using the Synthetic Precipitation Leaching Procedure (SPLP) to characterize the potential for regulated substances to leach from the fill and impact groundwater.

In addition to the fill samples, samples of the native soil were collected at TP-2 and TP-4. The soil samples were preserved in the field using laboratory bottleware, placed in a cooler with ice, and delivered to LLE following standard chain-of-custody procedures for analysis of PPL VOCs, PPL SVOCs, pesticides and

herbicides, and PPL metals. Sample analytical results are summarized on **Table 4**. Laboratory analytical data reports are attached in **Appendix B**.

#### **4.5 FORMER QUARRY SAMPLING AND ANALYSIS**

One surface water sample (WS-1) was collected from the existing quarry on July 5, 2017. The surface water sample was collected based on the Phase I ESA interview information. The water sample was collected with a clean, disposable Teflon bailer, preserved in the field using laboratory bottleware, placed in a cooler with ice, and delivered to LLE following standard chain-of-custody procedures for analysis of PPL VOCs, PPL SVOCs and PPL metals. Sample analytical results indicate that none of the VOCs or SVOCs were detected except for toluene at a concentration of 1.0 microgram per liter ( $\mu\text{g}/\text{L}$ ). Several metals were detected in the surface water sample, including copper, lead, nickel and zinc at concentrations of 12.2, 11.8, 8.0 and 101  $\mu\text{g}/\text{L}$ , respectively. Of the regulated substances detected, only lead exceeds its Act 2 nonresidential Statewide Health Standard Medium Specific Concentrations (MSCs) of 5  $\mu\text{g}/\text{L}$ ; however, groundwater remediation standards do not apply to surface water. Assuming that the former quarry discharges to Strickler Run, additional sampling and instream flow modeling would be necessary to determine applicable surface water standards for the regulated substances detected in the surface water sample. Laboratory analytical data reports are attached in **Appendix B**.

#### **4.6 GEOPHYSICAL SURVEY**

On July 18, 2017, a RETTEW geophysicist performed an EM-31 survey of the runway areas in an attempt to estimate the aerial extent of foundry sand containing metallic materials placed in the Eastern Fill Area. The EM-31 survey was initiated in the Eastern Fill Area using a grid on 10-foot centers, followed by an exploratory traverse of each runway centerline to detect the potential presence of conductive materials (i.e., in-phase response indicative of metal). The EM-31 survey results are shown on **Figure 5**. The EM-31 survey showed an area of conductive material correlating to the foundry sand that was observed in TP-1 through TP-6. The exploratory traverses also showed an area of in-phase response in the northern portion of the Site consistent with foundry sand (Northern Fill Area).

#### **4.7 CONFIRMATORY TEST PIT EXCAVATION**

The findings of the July 5, 2017 test pits and the EM-31 survey conducted on July 18, 2017 were used to identify areas where foundry sand fill material was most likely to be present. On July 19, 2017, RETTEW retained RTW to excavate 10 additional test pits (TP-7 through TP-16) across the Site utilizing a back hoe to observe and confirm the presence or absence of foundry sand fill materials. Test pit locations and the estimated extent of this "Northern Fill Area" are shown on **Figure 5**. Black granular foundry sand fill materials were observed in test pits TP-7 (0.5 to seven feet bgs), TP-8 (two to 10 feet bgs) and TP-10 (one to four feet bgs). Foundry sand was not observed in the remaining test pits.

### **5.0 FILL AND SOIL QUALITY**

RETTEW understands that the Site is planned for commercial (i.e., nonresidential) redevelopment with the exception of the conservation easements shown on **Figure 5**. Fill and soil sample analytical results were reviewed and compared to applicable Act 2 nonresidential Statewide Health Standard Medium Specific Concentrations (MSCs) to determine if fill and soil quality met PADEP remediation standards. The findings are described below for each REC identified in the Phase I ESA.

#### **Underground Storage Tanks**

Soil sample analytical results were compared to applicable Act 2 MSCs listed in **Table 1** for nonresidential used aquifers. The results show that 1,2,4-trimethylbenzene (TMB) does not meet its Statewide Health Standard MSCs at SB-3, SB-4 and SB-5. It is noted that these samples were collected at or below the

highest observed water table (nine feet bgs). Per the Act 2 *Technical Guidance Manual*, 1/10 of the Generic Value is used to calculate the applicable Act 2 Soil to Groundwater MSC in the "zone of groundwater saturation", or the vertical interval of water table fluctuation. For this assessment, it is assumed that the seasonal high water table near the USTs is nine feet bgs, although properly constructed groundwater monitoring wells would be needed to verify seasonal water table fluctuations over a full hydrologic cycle of approximately one year. The exceedance of the Act 2 Soil to Groundwater MSCs at SB-3, SB-4 and SB-5 indicates that the soil has been impacted by regulated substances released from the aviation gasoline USTs, and the regulated substances have the potential to leach out of the soil and impact groundwater.

#### Western Fill Areas

Analytical results for the fill samples collected at TP-1 through TP-6 were compared to the Act 2 MSCs listed in **Table 2** for nonresidential used aquifers. The results show that multiple regulated substances, including VOCs, SVOCs, pesticides and herbicides, and metals were detected in the fill. Most of the regulated substances were detected at concentrations below their nonresidential MSCs; however, benzo(a)pyrene was detected above the surface soil Direct Contact nonresidential MSC at TP-2. Benzo(a)pyrene was also detected at a concentration above its residential surface soil Direct Contact MSC at TP-4 and TP-5. It is noted that TP-4 and TP-5 are located in a conservation easement, where the residential MSCs are assumed to apply. Although benzo(a)pyrene was detected at depths below the interval where the surface soil Direct Contact MSC applies (zero to two feet bgs), the fill material was observed to have the same composition throughout the depth interval investigated, and it is assumed to be similar within two feet of the surface where the surface soil Direct Contact MSCs apply.

Analytical results for the soil samples collected at TP-4 through TP-6 below the fill were compared to the Act 2 MSCs listed in **Table 2** for nonresidential used aquifers. The results show that the sample results meet their applicable nonresidential MSCs at the depth intervals sampled.

The SPLP analytical results for the fill samples collected at TP-1 through TP-6 were compared to the Act 2 groundwater MSCs listed in **Table 3** for nonresidential used aquifers. The results show that the fill produced a leachate that exceeded the groundwater MSCs for multiple SVOCs in each sample. In addition, lead was detected at a concentration above the groundwater MSC in the leachate from the fill sample collected at TP-2.

#### Eastern Fill Area

Analytical results for the fill samples (foundry sand) collected at TP-1 through TP-5 were compared to the Act 2 MSCs listed in **Table 4** for nonresidential used aquifers. The results show that multiple regulated substances, including VOCs, SVOCs, pesticides and herbicides, and metals, were detected in the fill. All of the regulated substances were detected at concentrations below their applicable MSCs.

Analytical results for the soil samples collected at TP-2 and TP-4 below the fill were compared to the Act 2 MSCs listed in **Table 4** for nonresidential used aquifers. The results show that the sample results meet their applicable nonresidential MSCs at the depth intervals sampled.

The SPLP analytical results for the fill samples collected at TP-1 through TP-6 were compared to the Act 2 groundwater MSCs. As of the date of this report, only SPLP for metals have been reported. The only regulated substance detected in the leachate was barium at concentrations well below the applicable Act 2 groundwater MSC. SPLP results for VOCs and SVOCs will be provided under separate cover as they become available. It is noted that the detected concentrations of SVOCs in the fill at TP-5 were similar to the detected concentrations of SVOCs in the Western Fill Areas, which produced a leachate that exceeded the Act 2 groundwater MSCs for several regulated substances.

It should also be noted that fill samples were not collected in the Northern Fill Area due to time and budgetary constraints. However, the foundry sand materials observed in the Northern Fill Area were very similar to those observed in the Eastern Fill Area.

## 6.0 SURFACE WATER QUALITY

Analytical results for the surface water sample collected at the former quarry (WS-1) indicated that toluene, copper, lead, nickel and zinc were detected. Assuming that the former quarry (elevation 262 feet) discharges to Strickler Run (elevation 254 feet) located approximately 200 feet south of the former quarry, further assessment of surface water quality is needed, including the collection and analysis of water samples from Strickler Run upstream and downstream of the former quarry, and instream flow modeling to calculate applicable Water Quality Based Effluent Limits (WQBELs) for the regulated substances detected. The source for the regulated substances in WS-1 is unknown, but could possibly be from the discharge of groundwater into the quarry from upgradient areas of the Site, or the result of abandoned materials within the quarry.

## 7.0 GROUNDWATER QUALITY

A groundwater assessment was not performed during this Phase II ESA; however, the results of soil sample analysis at UST soil borings SB-3, SB-4 and SB-5 indicate that soil has been impacted by regulated substances released from the aviation gasoline USTs, and some of these regulated substances have the potential to leach out of the soil and threaten groundwater. Fill leachate containing regulated substances at concentrations above the groundwater MSCs for nonresidential used aquifers suggests that there is potential for groundwater impact below the Western Fill Areas; however, soil sample analytical results at TP-4, TP-5 and TP-6 meet the Soil to Groundwater MSCs protective of groundwater.

## 8.0 CONCLUSIONS

The findings of the Limited Phase II ESA performed by RETTEW at the Site indicate that current soil quality does not meet the Act 2 nonresidential Statewide Health Standards. This section summarizes the investigative findings at each REC identified during the Phase I and II ESA, and provides recommendations to bring the Site into compliance with PADEP regulations based upon the Borough's plan to redevelop the Site for commercial and nonresidential land use.

### Underground Storage Tanks

Soil sample analytical results show that several regulated substances (naphthalene, 1,2,4-trimethylbenzene (TMB) and 1,3,5-TMB) do not meet their applicable Act 2 nonresidential Soil to Groundwater MSCs at SB-3, SB-4 and SB-5. Groundwater was encountered in the borings between nine and 12 feet bgs, and bedrock was encountered between 12 and 14 feet bgs. Due to the presence of shallow groundwater and exceedances of the Soil to Groundwater MSCs, groundwater was likely impacted by regulated substances released from the aviation gasoline USTs. Further, the soil sample analytical results for 1,2,4-TMB do not meet the PADEP vapor intrusion screening values for soil, indicating the potential for impacts to indoor air.

The aviation gasoline USTs were reportedly "inspected" in 2014, and were found to be liquid empty and contained a minor amount of condensation. If the USTs are empty, they are not considered regulated tanks by the PADEP. USTs containing heating oil are also not regulated by the PADEP. If a release is confirmed from the aviation gasoline USTs and remediation is required, the methods and standards of Act 2 will apply during site characterization, remediation, and attainment demonstration. In addition, the soil sample analytical results for 1,2,4-TMB do not meet the PADEP vapor intrusion screening values;

therefore, a vapor intrusion assessment will be required after the full extent of soil and groundwater impacts are defined.

Due to the presence of TMB exceeding the Act 2 nonresidential MSCs, there is evidence of a release of petroleum at the Site. At a minimum, the release must be investigated. Closure by removal is recommended for all USTs at the Site. The aviation gasoline tanks are reported to be empty and the fuel oil UST is an unregulated tank; therefore, the remediation of a release from any of the UST systems should follow Act 2 protocols for unregulated tanks.

#### Western Fill Areas

The fill materials observed were predominantly asphalt, road millings and crushed stone characterized as construction and demolition waste. The fill materials do not meet the nonresidential Act 2 surface soil Direct Contact MSCs for benzo(a)pyrene at TP-2, indicating that the fill could pose a health risk to humans that come in contact with it. Benzo(a)pyrene also exceeded its residential surface soil Direct Contact MSC at TP-4 and TP-5 located within a conservation easement where the residential MSCs are assumed to apply. Although benzo(a)pyrene was detected at depths below the interval where the surface soil Direct Contact MSC applies (zero to two feet bgs), the fill material was observed to have the same composition throughout the depth interval investigated, and it is assumed to be similar within two feet of the surface where the surface soil Direct Contact MSCs apply. Surface fill quality (upper two feet) of the fill material should be investigated further to evaluate the direct contact exposure pathway for humans.

Samples of the fill that were analyzed using SPLP methods produced leachate that exceeds Act 2 groundwater MSCs for nonresidential used aquifers. It is noted that soil samples collected from below the fill at TP-4, TP-5 and TP-6 meet the Act 2 Soil to Groundwater MSCs, which are protective of groundwater. Although the potential exists for the leachate to impact Site groundwater, it has not adversely impacted the soil below the fill at TP-4, TP-5 and TP-6.

Most of the fill materials in the Western Fill Areas were placed on the Site sometime after 1990, and is generally characterized as construction/demolition waste that would have been considered "clean fill" under PADEP waste regulations at the time of placement. However, fill leachate contains concentrations of regulated substances (SVOCs) that exceed applicable Act 2 groundwater MSCs and have potential to impact groundwater. Due to the extent, depth and volume of fill materials present, removal of the fill material is not feasible. Further evaluation and on-site management of the fill is recommended prior to Site redevelopment.

#### Eastern and Northern Fill Areas

The fill materials observed (foundry sand) consisted primarily of a black granular matrix with minor amounts of other fill materials such as slag, metal fragments, brick, stone and rock. The fill materials sampled meet the nonresidential MSCs.

Complete SPLP results for the fill material were not available as of the date of this report and will be provided under separate cover as they become available. It is noted that the detected concentrations of SVOCs in the fill at TP-5 were similar to the detected concentrations of SVOCs in the Western Fill Areas, which produced a leachate that exceeded the Act 2 groundwater MSCs for several regulated substances.

The findings of the EM-31 survey and the confirmatory test excavations revealed a separate area of foundry sand placed on the northern portion of the Site as shown on **Figure 5**. This area is referred to as the "Northern Fill Area". It appears that the foundry sand was placed on the Site in the 1950s and 1960s based on a review of historic aerial photographs. Foundry sand is a waste of an industrial process and is considered a residual waste by PADEP definition; therefore, it cannot be managed as "clean fill". Due to

the extent, depth and volume of the foundry sand present, removal of it is not feasible. Further evaluation and on-site management of the fill is recommended prior to Site redevelopment.

#### Former Quarry

Due to the presence of elevated concentrations of lead in surface water within the former quarry, additional investigation is recommended. The hydrology of the Site and characterization of the flow between the former quarry and Strickler Run is needed. Surface water samples of Strickler Run and instream flow modeling is needed to calculate applicable Water Quality Based Effluent Limits (WQBELs) and assess the impacts of the former quarry. The source for the regulated substances in the former quarry is unknown and may be related to either the discharge of groundwater into the quarry from upgradient areas, or the presence of abandoned materials within the quarry. An investigation of the former quarry should be coupled with a groundwater investigation of the above RECs, is needed.

## **9.0 RECOMMENDATIONS**

#### Underground Storage Tank Closure and Remediation

RETTEW recommends the permanent closure of the UST systems by removal. Following the removal of the USTs, confirmatory soil and groundwater samples are recommended to assess soil and groundwater quality remaining at the Site and determine an appropriate path forward toward Act 2 liability protection. It is likely that full site characterization and remediation will be needed to delineate the extent of the soil and groundwater impacts, and mitigate the release. The following corrective action is recommended:

- Removal of all USTs;
- Excavation and off-site disposal of obviously-contaminated soil (i.e., petroleum-stained soil, separate-phase product, etc.);
- Collection and laboratory analysis of soil samples to demonstrate attainment of an Act 2 remediation standard;
- Installation of a groundwater monitoring well network and assessment of groundwater quality;
- Remediation of groundwater and soil, if necessary;
- Assessment of the vapor intrusion exposure pathway; and
- Demonstration of attainment of an Act 2 remediation standard for groundwater.

The appropriate level of soil and groundwater remediation needed to attain an Act 2 remediation will depend on the delineated extent of petroleum impacts and affected receptors based upon future land use.

#### On-Site Management of Fill Materials

Compliant, in-place management of fill materials, or “non-media solids”, can be achieved by attaining Act 2 remediation standards. According to the *Act 2 Technical Guidance Manual* and PADEP waste regulations, the non-media solids must be closed in-place by using pathway elimination under the Act 2 Site-Specific Standard. Any one or a combination of Act 2 standards may be applied to soil and groundwater outside the perimeter of the fill areas. Closure in-place and pathway elimination could involve a combination of impermeable capping, covering, grading and revegetation of the non-media solids to prevent infiltration, erosion and the entrainment of regulated substances in groundwater recharge and runoff. An assessment of soil and groundwater quality outside the perimeter of the fill areas will require soil sampling and laboratory analysis, as well as groundwater sampling and analysis using properly constructed monitoring wells.

Sampling and analysis of the surface material is also recommended to further evaluate the direct contact exposure pathway. This is particularly important within the conservation easements, if public access for recreational purposes is planned.

If non-media solids are cut during Site grading activities and relocated to other areas of the Site, attainment of an Act 2 standard will be required for the placement of the relocated material. If the foundry sand is removed from the Site, it must be handled, transported and disposed as residual waste at a PADEP-approved disposal facility.

If redevelopment of the Site involves the design and construction of stormwater BMPs over non-media solids, special attention should be given to minimize disturbance of capped or covered areas required to attain an Act 2 standard. Utility line excavations and grading activities should also be avoided in capped or covered areas. Structural stormwater infiltration best management practices (BMPs) should be avoided in areas where regulated substances are known to leach from the non-media solids. Site redevelopment plans can be designed to achieve closure in-place of non-media solids using pathway elimination under the Act 2 Site-Specific Standard as follows:

- Placement of building slabs, parking areas and paved driveways over areas of non-media solids;
- Use of impermeable geotextile liners or compacted clay liners to prevent infiltration of stormwater over areas of non-media solids; and
- Placement of a minimum of two feet of clean topsoil cover over areas of non-media solids to eliminate the direct contact exposure pathway, particularly within recreational areas.

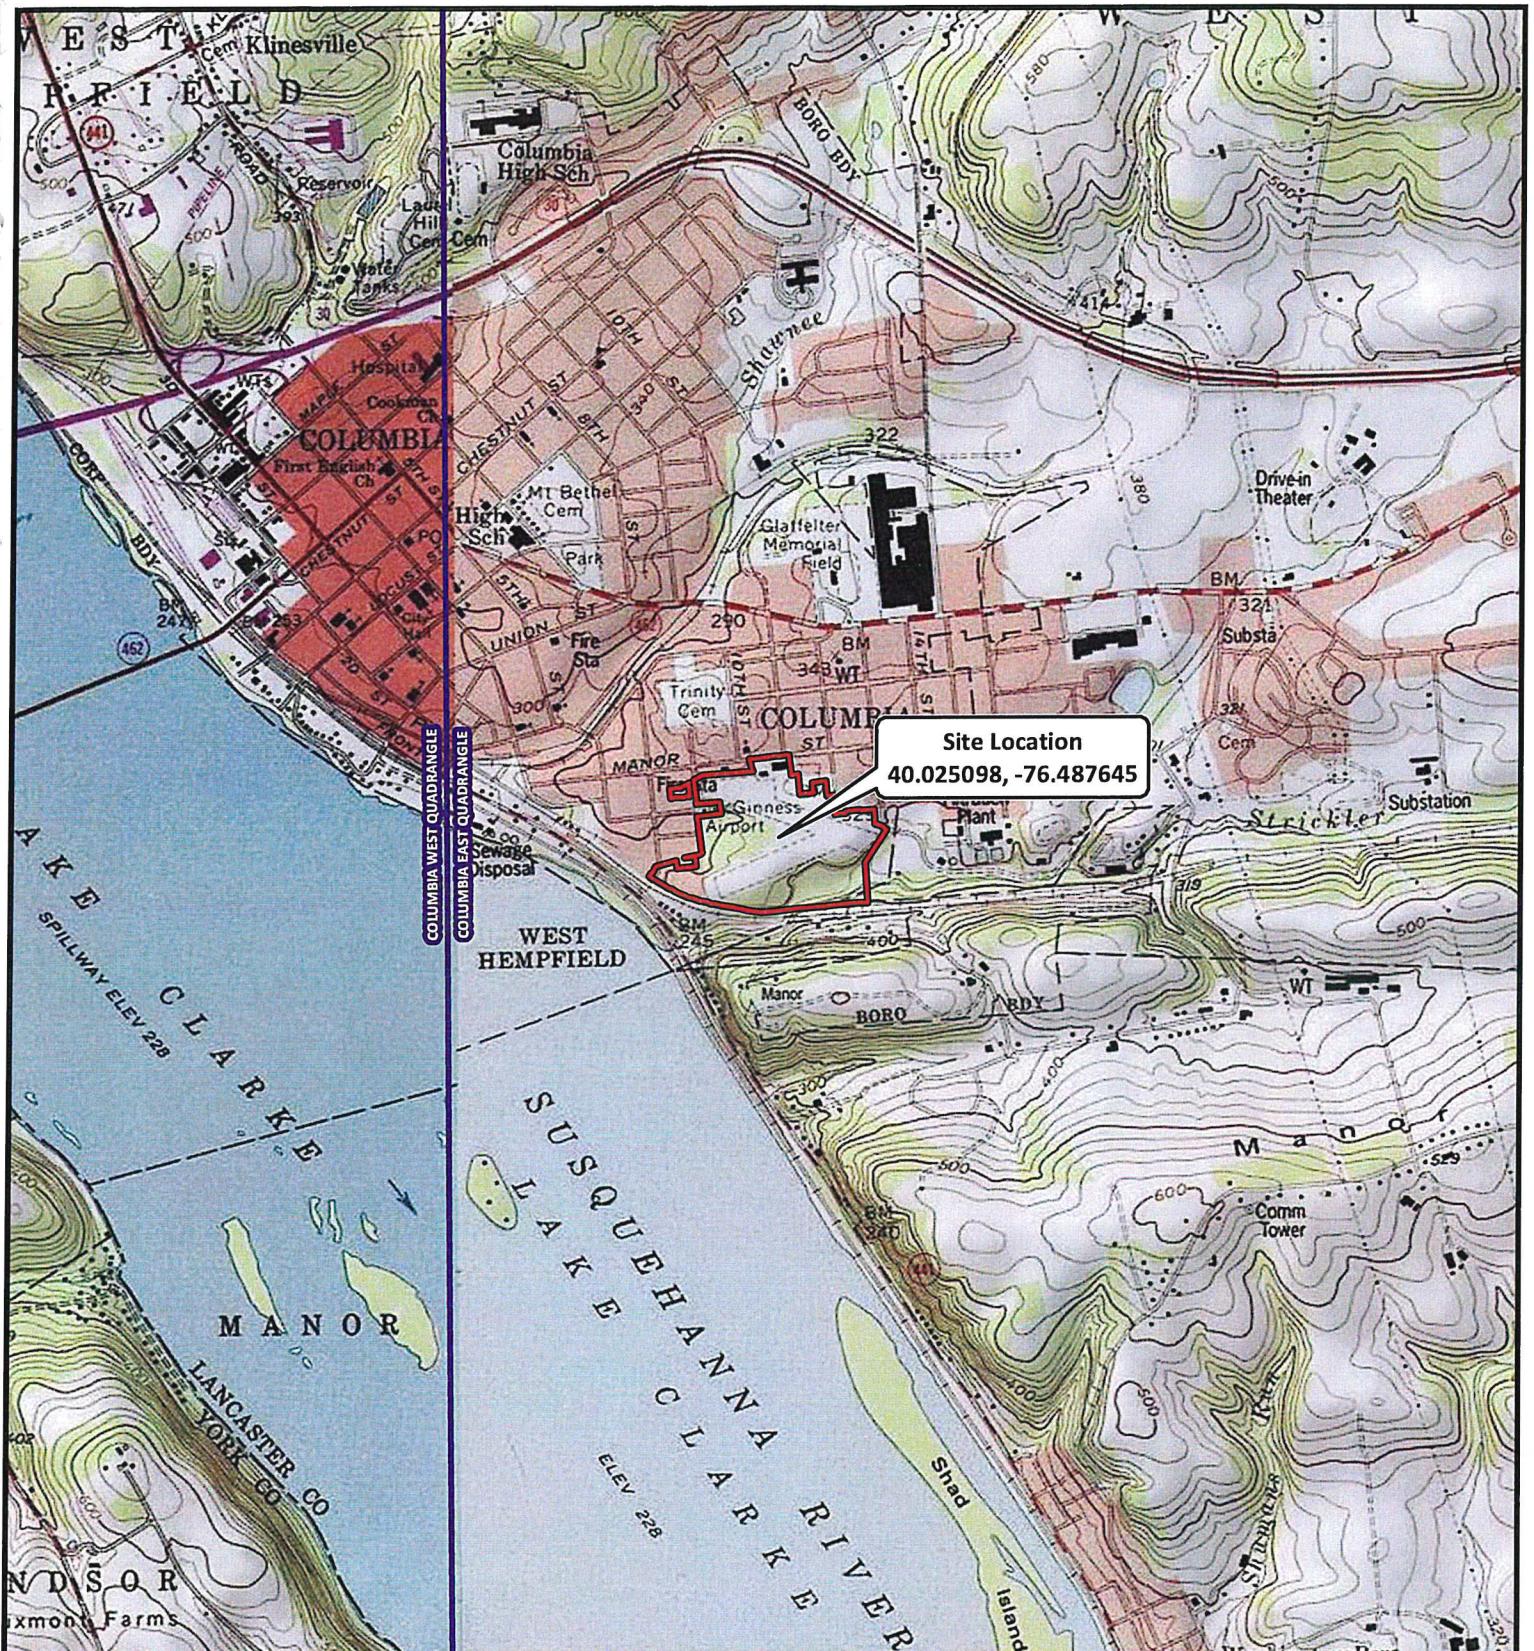

It is noted that an environmental covenant is not required for nonresidential land use if the nonresidential MSCs can be attained without the use of engineering controls. Because the Site will require impermeable capping of fill materials in places, an environmental covenant will be needed to control land use, provide for inspection and maintenance of capped areas, and may potentially include postremediation care provisions for compliance groundwater monitoring. It is strongly recommended to enter the Act 2 process and present a remediation plan to the PADEP that will attain Act 2 remediation standards for soil and groundwater prior to Site redevelopment. The following Site characterization activities are recommended prior to planning Site redevelopment:

- A geophysical survey of the entire Site to delineate the extent of non-media solids;
- Additional test pits along the perimeter of the delineated areas of non-media solids to confirm and refine the findings of the geophysical survey;
- Collection of surface samples (upper two feet) and laboratory analysis to further evaluate the direct contact exposure pathway where non-media solids are identified;
- Soil borings and soil sample collection for laboratory analysis to evaluate soil quality outside the areas of delineated non-media solids; and
- Installation of properly constructed groundwater monitoring wells outside the perimeter of the non-media solids to assess groundwater flow direction and groundwater quality, if needed.

The appropriate level of soil and groundwater characterization needed to attain an Act 2 remediation standard will depend on the delineated extent of non-media solids and potential receptors based upon future land use.

Notes:

1) All units in micrograms per kilogram (µg/kg)

2) Bold & shaded MSCs represent the applicable Act 2 nonresidential Statewide Health Standard.

3) Bold and shaded results represent an exceedance of the applicable nonresidential Direct Contact MSCs.

4) Shaded results represent an exceedance of the applicable residential Direct Contact MSCs.

5) Fill and soil samples were collected on June 2, 2017.

6) J = Estimated concentration detected between the Method Detection Limit and the laboratory Limit of Quantitation.

Notes:

1) All units in micrograms per kilogram ( $\mu\text{g}/\text{kg}$ ).

2) Bold & shaded MSCs represent the applicable Act 2 nonresidential Statewide Health Standard.

3) Bold and shaded results represent an exceedance of the applicable nonresidential Direct Contact MSCs.

4) Shaded results represent an exceedance of the applicable residential Direct Contact MSCs.

5) Fill and soil samples were collected on July 5, 2017.

6) J = Estimated concentration detected between the Method Detection Limit and the laboratory Limit of Quantitation.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.					

#### Sample Comments

PA DEP Lab Certification ID 36-00037, Expiration Date: 1/31/18.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

**Quality Control Summary**

Client Name: Rettew Associates  
 Reported: 06/13/2017 15:23

Group Number: 1808705

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

The recovery for a target analyte(s) in the Laboratory Control Spike(s) is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken:

The sample was re-extracted outside the method required holding time and the QC is compliant. All results are reported from the first trial. Similar results were obtained in both trials.

2-Chloroethyl vinyl ether is an acid labile compound and cannot be reported due to acid preservation of the samples and standards in this method.

The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken:

The sample was re-analyzed and the QC is again outside of the acceptance limits, indicating a matrix effect. The data is reported from the initial trial.

Reporting limits were raised due to interference from the sample matrix.

The surrogate data is outside the QC limits due to unresolvable matrix problems evident in the sample chromatogram.

The recovery for a target analyte(s) in the Laboratory Control Spike(s) is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken:

The sample was re-extracted outside the method required holding time and the QC is compliant. All results are reported from the first trial. Similar results were obtained in both trials.

10727	2,4,6-Trichlorophenol	88-06-2	N.D. Q4	0.017	1

The recovery for a target analyte(s) in the Laboratory Control Spike(s) is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken:

The sample was re-extracted outside the method required holding time and the QC is compliant. All results are reported from the first trial. Similar results were obtained in both trials.

Metals	SW-846 6010B	mg/l	mg/l

#### Sample Comments

PA DEP Lab Certification ID 36-00037, Expiration Date: 1/31/18.

If the analysis is for determination of Hazardous Waste Characteristics, see Table 1 in EPA Code of Federal Regulations 40 CFR 261.24.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.					

#### Sample Comments

PA DEP Lab Certification ID 36-00037, Expiration Date: 1/31/18.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken:  
The sample was re-analyzed and the QC is again outside of the acceptance limits, indicating a matrix effect. The data is reported from the initial trial.

2-Chloroethyl vinyl ether is an acid labile compound and cannot be reported due to acid preservation of the samples and standards in this method.

Reporting limits were raised due to interference from the sample matrix.

The surrogate data is outside the QC limits due to unresolvable matrix problems evident in the sample chromatogram.

#### Sample Comments

PA DEP Lab Certification ID 36-00037, Expiration Date: 1/31/18.

If the analysis is for determination of Hazardous Waste Characteristics, see Table 1 in EPA Code of Federal Regulations 40 CFR 261.24.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

The recovery for a target analyte(s) in the Laboratory Control Spike(s) is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken:

The sample was re-extracted outside the method required holding time and the QC is compliant. All results are reported from the first trial. Similar results were obtained in both trials.

The response for a target analyte(s) in the continuing calibration verification standard is outside the QC acceptance limits. Since the response is high indicating increased sensitivity, and the target analyte(s) is not detected in the sample, the data is reported.

The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken:  
The sample was re-analyzed and the QC is again outside of the acceptance limits, indicating a matrix effect. The data is reported from the initial trial.

2-Chloroethyl vinyl ether is an acid labile compound and cannot be reported due to acid preservation of the samples and standards in this method.

The recovery for a target analyte(s) in the Laboratory Control Spike(s) is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken:

The sample was re-extracted outside the method required holding time and the QC is compliant. All results are reported from the first trial. Similar results were obtained in both trials.

The response for a target analyte(s) in the continuing calibration verification standard is outside the QC acceptance limits. Since the response is high indicating increased sensitivity, and the target analyte(s) is not detected in the sample, the data is reported.

The recovery for a target analyte(s) in the Laboratory Control Spike(s) is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken:

The sample was re-extracted outside the method required holding time and the QC is compliant. All results are reported from the first trial. Similar results were obtained in both trials.

10401	2,4,5-TP	93-72-1	N.D. Q4	0.91	1

The recovery for a target analyte(s) in the Laboratory Control Spike(s) is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken:

The sample was re-extracted outside the method required holding time and the QC is compliant. All results are reported from the first trial. Similar results were obtained in both trials.

The response for a target analyte(s) in the continuing calibration verification standard is outside the QC acceptance limits. Since the response is high indicating increased sensitivity, and the target analyte(s) is not detected in the sample, the data is reported.

The recovery for a target analyte(s) in the Laboratory Control Spike(s) is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken:  
The sample was re-extracted outside the method required holding time and the QC is compliant. All results are reported from the first trial. Similar results were obtained in both trials.

#### Sample Comments

PA DEP Lab Certification ID 36-00037, Expiration Date: 1/31/18.

If the analysis is for determination of Hazardous Waste Characteristics, see Table 1 in EPA Code of Federal Regulations 40 CFR 261.24.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

**Quality Control Summary**

Client Name: Rettew Associates  
 Reported: 06/28/2017 13:14

Group Number: 1808709

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

**Method Blank**

2	DT131	4.1	DT	Wet	Y	Bagged	N

# Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

<b>BMQL</b>	Below Minimum Quantitation Level	<b>mg</b>	milligram(s)
<b>C</b>	degrees Celsius	<b>mL</b>	milliliter(s)
<b>cfu</b>	colony forming units	<b>MPN</b>	Most Probable Number
<b>CP Units</b>	cobalt-chloroplatinate units	<b>N.D.</b>	none detected
<b>F</b>	degrees Fahrenheit	<b>ng</b>	nanogram(s)
<b>g</b>	gram(s)	<b>NTU</b>	nephelometric turbidity units
<b>IU</b>	International Units	<b>pg/L</b>	picogram/liter
<b>kg</b>	kilogram(s)	<b>RL</b>	Reporting Limit
<b>L</b>	liter(s)	<b>TNTC</b>	Too Numerous To Count
<b>lb.</b>	pound(s)	<b>µg</b>	microgram(s)
<b>m3</b>	cubic meter(s)	<b>µL</b>	microliter(s)
<b>meq</b>	milliequivalents	<b>umhos/cm</b>	micromhos/cm
<	less than		
>	greater than		
<b>ppm</b>	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.		
<b>ppb</b>	parts per billion		
<b>Dry weight basis</b>	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.		

## Laboratory Data Qualifiers:

- C - Result confirmed by reanalysis
- E - Concentration exceeds the calibration range
- J (or G, I, X) - estimated value  $\geq$  the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
- P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
- U - Analyte was not detected at the value indicated
- V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference...
- W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.  
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

**Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.**

Measurement uncertainty values, as applicable, are available upon request.

Test results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" are not performed within 15 minutes.

**WARRANTY AND LIMITS OF LIABILITY** - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

## Additional Data Qualifiers

Qualifier	Definition
B	Detection in the Blank
Q0	LCS/LCSD Low
Q1	LCS/LCSD High
Q4	MS/MSD Out of Range
Q7	LCS/LCSD RPD
Q8	DUP RPD
Q9	MS/MSD RPD
Z	Laboratory Defined - see analysis report

The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken:

The sample was re-analyzed and the QC is again outside of the acceptance limits, indicating a matrix effect. The data is reported from the initial trial.

2-Chloroethyl vinyl ether is an acid labile compound and cannot be reported due to acid preservation of the samples and standards in this method.

#### Sample Comments

PA DEP Lab Certification ID 36-00037, Expiration Date: 1/31/18.

If the analysis is for determination of Hazardous Waste Characteristics,  
see Table 1 in EPA Code of Federal Regulations 40 CFR 261.24.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

2-Chloroethyl vinyl ether is an acid labile compound and cannot be reported due to acid preservation of the samples and standards in this method.

The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken:  
The sample was re-analyzed and the QC is again outside of the acceptance limits, indicating a matrix effect. The data is reported from the initial trial.

#### Sample Comments

PA DEP Lab Certification ID 36-00037, Expiration Date: 1/31/18.

If the analysis is for determination of Hazardous Waste Characteristics, see Table 1 in EPA Code of Federal Regulations 40 CFR 261.24.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

## Sample Comments

PA DEP Lab Certification ID 36-00037, Expiration Date: 1/31/18.

If the analysis is for determination of Hazardous Waste Characteristics,  
see Table 1 in EPA Code of Federal Regulations 40 CFR 261.24.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken:

The sample was re-analyzed and the QC is again outside of the acceptance limits, indicating a matrix effect. The data is reported from the initial trial.

2-Chloroethyl vinyl ether is an acid labile compound and cannot be reported due to acid preservation of the samples and standards in this method.

<b>Wet Chemistry</b>					
00111	Moisture	SM 2540 G-1997 n.a.	% 13.2	% 0.50	1

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.

#### Sample Comments

PA DEP Lab Certification ID 36-00037, Expiration Date: 1/31/18.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

**Quality Control Summary**

Client Name: Rettew Associates  
 Reported: 07/19/2017 14:10

Group Number: 1821787

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

**Method Blank**

\*- Outside of specification

(1) The result for one or both determinations was less than five times the LOQ.

(2) The unspiked result was more than four times the spike added.

P##### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

# Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

<b>BMQL</b>	Below Minimum Quantitation Level	<b>mg</b>	milligram(s)
<b>C</b>	degrees Celsius	<b>mL</b>	milliliter(s)
<b>cfu</b>	colony forming units	<b>MPN</b>	Most Probable Number
<b>CP Units</b>	cobalt-chloroplatinate units	<b>N.D.</b>	none detected
<b>F</b>	degrees Fahrenheit	<b>ng</b>	nanogram(s)
<b>g</b>	gram(s)	<b>NTU</b>	nephelometric turbidity units
<b>IU</b>	International Units	<b>pg/L</b>	picogram/liter
<b>kg</b>	kilogram(s)	<b>RL</b>	Reporting Limit
<b>L</b>	liter(s)	<b>TNTC</b>	Too Numerous To Count
<b>lb.</b>	pound(s)	<b>µg</b>	microgram(s)
<b>m3</b>	cubic meter(s)	<b>µL</b>	microliter(s)
<b>meq</b>	milliequivalents	<b>umhos/cm</b>	micromhos/cm
<	less than		
>	greater than		
<b>ppm</b>	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.		
<b>ppb</b>	parts per billion		
<b>Dry weight basis</b>	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.		

## Laboratory Data Qualifiers:

- C - Result confirmed by reanalysis
- E - Concentration exceeds the calibration range
- J (or G, I, X) - estimated value  $\geq$  the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
- P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
- U - Analyte was not detected at the value indicated
- V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference...
- W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.  
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

## Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" are not performed within 15 minutes.

**WARRANTY AND LIMITS OF LIABILITY** - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROTINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROTINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROTINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.
